METHOD AND APPARATUS FOR CASE BUILDING AND PRESENTATION OF HEALTHCARE PROCEDURES

ABSTRACT OF THE DISCLOSURE

A presentation detailing a recommended course of treatment to a patient, frequently referred to as a case, is constructed with a single action. The presentation describes recommended healthcare procedures for a given patient using information specific to that patient's healthcare record. The presentation is constructed by assembling information on the recommended healthcare procedures and all necessary clinical and financial information for the patient stored in a healthcare management desktop application into a template having a format accepted by any standard presentation software program. Finally, using the presentation software program, the recommended course of treatment is presented to the patient. In addition, the presentation software program includes tools to permit customization and storage of each constructed presentation.
